# J.M. Canty Inc. 

## Cereal Particle Size

## Sample consisting of:

$1 \quad \sim 5$ pound cereal loops, 1
$2 \quad \sim 5$ pound cereal loops, 2
$3 \sim 5$ pound cereal loops, '3
4 partial of 5 pound cereal loops, 4
5 partial of 5 pound cereal loops, 5

Purpose of test - To establish a measurement method to characterize the pellet form of the cereal loops supplied in these samples. The activity reported here details a measurement of the outside diameter (OD) and hole size for the loops as the product passes through the Canty SolidSizer TS.

General - Each of the five product samples was examined as detailed in section 2 following. The measurements reported there were made under the same conditions and thus serve to characterize each sample for comparison with the others. A small number of pellets were measured with a caliper to verify results and to perform a reality check.

## SECTION 2

Test Setup Description - Each sample is examined individually as follows:
Loops are loaded into the feed hopper of the SolidSizer and conveyed past the camera system.
Light is supplied from the top as is view - this is the Black Speck configuration of the unit.

DETAILS - Numerical results are shown for each sample, averaged for 3000 measurements

| Sample Number | OD, mm | OD Std Dev | Hole <br> Diameter, mm | Hole Std Dev |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 8.269 | 0.735 | 2.575 | 0.479 |
| 2 | 8.297 | 0.821 | 2.464 | 0.484 |
| 3 | 8.335 | 0.747 | 2.377 | 0.490 |
| 4 | 8.201 | 0.995 | 2.370 | 0.501 |
| 5 | 8.189 | 0.940 | 2.385 | 0.489 |

Screen images of Lab Test, typical for each sample is shown in the following figures.

| 21 |  |  | average units | for 20 |

A comparison between the mechanical manual measurement above and the Vector measurement of 3000 OD and hole measurements is shown:

| Vector OD | 9.136 mm | hole | 3.231 mm |
| ---: | :--- | :--- | :--- |
| SD | 2.477 |  | 0.687 |

The measurements made manually are an indicator of system accuracy. The vector software generally tends to find the largest diameter around the entire circumference whereas the manual measurement is more subjective. Still the results, though slightly different, are consistent for both methods and thus the system can provide repeatable, accurate data.
